Your Claude Code transcripts are a security blind spot

01 / 06

01

The blind spot

Every Claude Code session leaves a transcript. Most teams never read it. That log knows which credentials you pasted into context.

02

What Spotlight does

Reads session logs post-run. Surfaces files touched, commands run, sensitive data that landed in context. Strips PII locally before anything leaves your machine.

03

Who built it

Seth Blank and team, backgrounds in security at Google, Valimail, Twilio, and Algolia. Free for individuals and teams. macOS, Linux, WSL 2.

04

The real risk

As agents get more production access, session logs become an audit trail whether you want them or not. Better to know what's in yours.

My bet

Session visibility is table stakes for prod AI coding by end of year. Backplanes either builds that standard or gets acquired.
