01

Siri runs on Gemini now

Apple's rebuilt Siri is powered by Google Gemini. On-device Apple models handle privacy-sensitive tasks; Gemini handles the cloud-side intelligence — revealed at WWDC today.

02

The deal: ~\$1B/year

Bloomberg reports Apple pays Google roughly \$1 billion per year for a custom Gemini model. It runs inside Apple's Private Cloud Compute — stateless, no user data retained after the query.

03

ChatGPT exclusivity: over

OpenAI's ChatGPT was Apple's first external AI partner in 2024. Gemini now takes the default spot. This is a direct shift in which lab sits closest to Apple's 1.4 billion users.

04

Three labs. One OS toggle.

Users can switch between ChatGPT, Gemini, and Claude as their Apple AI. All three major assistants are now inside iOS 27 through Apple's Extensions system.

05

What builders should watch

Default matters most — Gemini wins the first-launch slot. But if users are choosing Claude or ChatGPT over it, distribution becomes about preference, not just OS positioning.

The question nobody's answered yet

When users can pick their AI inside an OS, does model quality win or does UX?
