

Microsoft

Microsoft built its own AI coding model. It beat Haiku.

01

What happened

Microsoft launched MAI-Code-1-Flash at Build 2026 on June 2. Built end-to-end in-house. Rolling out now to GitHub Copilot Free, Pro, and Max in VS Code.

02

The benchmark

SWE-Bench Pro: MAI-Code-1-Flash 51.2%, Claude Haiku 4.5 35.2%. Also uses 60% fewer tokens on complex tasks. Small model, sharper than expected.

03

The OpenAI angle

Microsoft put \$13B into OpenAI and built Copilot on their models. MAI-Code-1 was trained end-to-end without them. That is a meaningful signal.

04

What changes for builders

If you run agents in Copilot all day, fewer tokens burned per task is real money. The efficiency gap between small and large models is closing faster than most expected.

05

The open question

Microsoft now has its own coding model outperforming third-party alternatives inside Copilot. How optional does the OpenAI dependency become from here?
