

SpaceX

The \$1.77T SpaceX IPO and what it says about AI money

swipe →

01

It prices June 11

\$135/share, \$1.77T valuation, \$75B raise. Biggest IPO in history, triple the prior record.

02

The AI pitch they're selling

Goldman Sachs models \$322B in AI revenue by 2030, up from \$3.2B last year. Orbital AI compute satellites planned as early as 2028.

03

S&P 500 already said no

SpaceX lost \$4.94B in 2025. Only 5% public float, minimum is 10%. Standard 12-month seasoning applies.

04

What the business actually is

Starlink: \$11.4B revenue in 2025, 69% of company revenue in Q1 2026. The AI compute future is a projection, not the product yet.

05

The question I keep asking

If public markets price AI infrastructure at \$1.77T on \$322B projections, what does that signal for everyone building the product layer today?

Biggest IPO ever. Or biggest bet?

June 12 we find out what conviction looks like at \$1.77 trillion.
